Why are System.Data.SQLite exceptions reusing my application id? My application is composed of separate projects which communicate using named pipes. It's in n-tier architecture. In one of the projects I use an SQLite database to store a big amount of data, some of which is user-specific and related to the user's session. When the application first starts the database isn't initialized yet, the first thing I do is just open the database and query the table which contains the connection info. I'm doing this because my database is offline and I want to save time while it's being put online. The database is created in a local folder which will be moved to a network share when I know I need it (and when the application has to be restarted). Unfortunately, some of the information in the database gets corrupted at the moment the database is made available (and thus the connection info is no longer valid). I manage to make a stable version of the database
